DESCRIPTION

The temperature stable ASNT5072-PQC SiGe IC provides extremely low jitter narrowband clock phase shifting capability between its input and output signal ports and is intended for use in high-speed measurement / test equipment. ASNT5072-PQC can process an up to 14GHz clock signal and deliver 0-120ps of adjustable phase delay through the up to 100MHz external adjustment of its differential tuning port. The part's I/Os support the CML logic interface with on chip 50Ω termination and may be used differentially, AC/DC coupled, single-ended, or in any combination. It operates from a single ±3.3V power supply.
